Wood remains the favorite choice for high-quality homes and structures. The old-world charm and quality of wood makes it one of the most sensible materials available in the 21st century. Here are a few reasons:

- Wood remains one of the most thermally-efficient materials known today.
- Wood is re-grown for future generations. Today, there are more trees in America than existed at the end of the 19th century.
- *“Wood is the standard material for residential windows. Ease-of-use makes for easier custom windows, which is why highly detailed designs are typically made from wood.” BobVilla.com*
- Wood lasts as long as the structure. Even many centuries-old buildings still have their original windows. They never go out of style, so you won't want to change them.
- Teak and mahogany woods are nearly maintenance free. Other woods need to be stained or sealed, and painted. Dents, scratches and gouges are easily repaired by filling, sanding and painting. Other materials require a lot of energy to manufacture and recycle, and they cannot be as easily repaired. They look their age, and typically color cannot be changed when you repaint the building.
- Wood takes less energy to produce than other building products, and excess wood material is easily recyclable during the fabrication process. Trees naturally store CO₂, so it is stored within the wood in buildings. It remains trapped until it is burned or decomposes. Other materials consume energy to make, and energy to recycle.

Wood is the natural and environmentally smart choice.
